# ACIDS, BASES AND SALTS

Definition of an acid	What causes the acidic properties of acids?			
An acid is a compound which when dissolved in water	The hydrogen ions (H+) cause the acidic properties and these are			
produces hydrogen ions as the only positively charged	formed in the presence of water.			
ions				

Another term to refer to an acid	Why an acid is also called a proton donor?		
An acid is called a <u>proton donor</u>	It's because an acid provides protons or hydrogen ions (H+) to other		
	substances during the reaction.		

Substance to which an acid provides protons	A base is then called	Why the base is called a proton acceptor?	Equation for the reaction between acid and base
BASE	PROTON ACCEPTOR	Because the base accepts hydrogen ions from acids	$H^{+}_{(aq)} + \overline{O}H_{(aq)} \longrightarrow H_{2}O_{(l)}$

Common laboratory acids		These three common laboratory acids are also called	Why these acids are also called mineral acids?
Hydrochloric acid	HC1		They are derived from mineral salts ie c <i>hlorides</i> for
Sulphuric acid	$H_2SO_4$	MINERAL ACIDS	HCl, sulphates for H <sub>2</sub> SO <sub>4</sub> and nitrates for HNO <sub>3</sub>
Nitric acid HNO <sub>3</sub>			

Other mineral acids known		Mineral salts from which the acid is derived	Organic acids known	Naturally occurring acids
Sulphurous acid H <sub>2</sub> SO <sub>3</sub>		Derived from sulphites	Ethanoic acid	CITRIC ACID from lemons
Carbonic acid H <sub>2</sub> CO <sub>3</sub>		Derived from carbonates	(CH₃COOH)	TARTARIC ACID from grapes
Phosphoric acid H <sub>3</sub> PO <sub>4</sub>		Derived from phosphates		ACETIC ACID from vinegar
Nitrous acid HNO <sub>3</sub>		Derived from nitrites	Methanoic acid	LACTIC ACID from sour milk
			(HCOOH)	Hydrochloric acid from digestive juices

Whenever an acid is dissolved in water, it produces	Term given to the number of hydrogen ions produced by one molecule of an acid	Definition of basicity of an acid
HYDROGEN IONS	BASICITY OF AN ACID	BASICITY of an acid is the <u>number of hydrogen ions</u> produced by <u>one molecule</u> of an acid <u>in aqueous solution</u> .

Basicity can also be defined as	Categorization of acids depending on basicity
BASICITY of an acid is the <u>number of hydrogen ions</u> produced by	Monobasic acids
one molecule of an acid when dissolved in water.	Dibasic acids
	Tribasic acids

Definition of	Its basicity	Examples of acids	Ionization equations of acids
Monobasic acid is an acid whose one		Nitric acid	$HNO_{3(aq)} \longrightarrow H^{+}_{(aq)} + NO_{3(aq)}^{-}$
molecule produces one hydrogen ion	Basicity of	Hydrochloric acid	$HCl_{(aq)} \longrightarrow H^{+}_{(aq)} + Cl_{(aq)}^{-}$
when dissolved in water.	monobasic	Nitrous acid	$HNO_{2(aq)} \longrightarrow H^{+}_{(aq)} + NO_{2(aq)}$
OR	acids is <b>ONE</b>	Ethanoic acid	$CH_3COOH_{(aq)} \longrightarrow H^+_{(aq)} + CH_3COO_{(aq)}$
<b>Monobasic acid</b> is an acid whose one		Hypochlorous acid	$HOC l_{(aq)} \longrightarrow H^{+}_{(aq)} + OC l_{(aq)}$
molecule produces one hydrogen ion when in aqueous solution.		Methanoic acid	$HCOOH_{(aq)} \longrightarrow H^{+}_{(aq)} + HCOO_{(aq)}$
<b>1</b>		Have general formula of <b>HX</b>	
<b>Dibasic acid</b> is an acid whose one		Sulphuric acid	$H_2SO_{4(aq)} \longrightarrow 2H^+_{(aq)} + SO_4^{2-}_{(aq)}$
molecule produces two hydrogen ions	Basicity of	Carbonic acid	$H_2CO_{3(aq)} = 2H^+_{(aq)} + CO_3^2_{(aq)}$
when dissolved in water.	Dibasic acids	Sulphurous acid	$H_2SO_{3(aq)} = 2H^+_{(aq)} + SO_3^{2-}_{(aq)}$
OR	is <b>TWO</b>	•	The double half arrows ( ) imply that the
<b><u>Dibasic acid</u></b> is an acid whose one		Have general formula	ionization of such an acid is reversible.
molecule produces two hydrogen ions		of $\mathbf{H_2X}$	Double half arrows ( ) mainly apply to weak
when in aqueous solution.		, and the second	acids
<b>Tribasic acid</b> is an acid whose one		Phosphoric acid	$H_3PO_{4(aq)} = 3H^+_{(aq)} + PO_4^{3-}_{(aq)}$
molecule produces three hydrogen ions	Basicity of		Important note on basicity of an acid
when dissolved in water.	Tribasic acids		Basicity of an acid is not necessarily the number
OR	is <b>THREE</b>		of hydrogen atoms contained in one molecule of
<u>Tribasic acid</u> is an acid whose one			the acid.
molecule produces three hydrogen ions		Have general formula	Basicity refers to the number of hydrogen atoms
when in aqueous solution.		of <b>H₃X</b>	capable of ionization in an acid for example;
			In CH₃COOH, its only one hydrogen atom that
			can ionize. The other three hydrogen atoms are
			incapable of ionization, THUS CH <sub>3</sub> COOH has
			basicity of 1

TYPE OF ACIDS	DEFINITION 1	DEFINITION 2
Strong acids	A strong acid is an acid which when dissolved in water produces ALL the hydrogen ions it contains.	A strong acid is an acid which completely ionizes in dilute solution.
Weak acids	A weak acid is an acid which when dissolved in water produces PART of the hydrogen ions it contains.	A weak acid is an acid which only slightly ionizes in dilute solution.

Examples of strong acids	Ionization equation for the acid when dissolved in water		
Hydrochloric acid	$HCl_{(aq)} \longrightarrow H^{+}_{(aq)} + Cl_{(aq)}^{-}$		
Sulphuric acid	$H_2SO_{4(aq)} \longrightarrow 2H^{+}_{(aq)} + SO_4^{2-}_{(aq)}$		
Nitric acid	$HNO_{3(aq)} \longrightarrow H^{+}_{(aq)} + NO_{3(aq)}^{-}$		

Examples of weak acids	Ionization equation for the acid when dissolved in water	
carbonic acid	$H_2CO_{3(aq)} = 2H^+_{(aq)} + CO_3^{2-}_{(aq)}$	
phosphoric acid	$H_3PO_{4(aq)} = 3H^+_{(aq)} + PO_4^{3-}_{(aq)}$	
Ethanoic acid	$CH_3COOH_{(aq)} \longrightarrow H^+_{(aq)} + CH_3COO_{(aq)}$	
Methanoic acid	$HCOOH_{(aq)} \implies H^+_{(aq)} + HCOO_{(aq)}$	

			TIE	S OF ACIDS				
Ph	PHYSICAL PROPERTIES  Physical properties of acids are those properties of acids that			Ch	CHEMICAL PROPERTIES  Chemical properties of acids are those properties of acids when they are involved in chemical reactions.			
1.	can be seen, felt and smelt.  1. Have a sour and sharp taste			1. STATEMENT(S)		REASON(S)
When a piece of aluminium foil is placed in a test tube	DECALICE	A thin protective layer forms on aluminium as soon as the
containing cold dilute hydrochloric acid, no reaction occurs.	BECAUSE	metal is exposed to moist air, which prevents any reaction.
When a piece of aluminium foil is placed in a test tube containing cold dilute sulphuric acid, no reaction occurs.	BECAUSE	A thin protective layer forms on aluminium as soon as the metal is exposed to moist air, which prevents any reaction.
If a piece of aluminium foil is placed in a test tube containing warm acid, a reaction occurs after a short while.	BECAUSE	The oxide layer on aluminium dissolves in the warm acid exposing the metal which reacts with the acid.
Copper does not liberate hydrogen with dilute acids.	BECAUSE	Copper is below hydrogen in the electrochemical series, thus cannot displace it from dilute acids.
Nitric acid does not liberate hydrogen with nitric acid except magnesium.	BECAUSE	Nitric acid is a strong oxidizing agent. It oxidizes the hydrogen formed immediately into water.

NOTE;

Magnesium only reacts with nitric acid when it is very dilute.

# **BASES AND ALKALIS**

Definition of a base	In general terms, bases are;	A reaction where an acid reacts with a base is called	
A base is a substance which reacts	Oxides of metals		
with an acid to form a salt and	Hydroxides of metals	NEUTRALIZATION REACTION	
water only.	Ammonium hydroxide		

# Definition of neutralization;

Neutralization is a reaction in which an acid reacts with a base to form a salt and water only.

Many bases exist but only a few are soluble in water

Examples of bases that are soluble in water		These soluble bases are called	Alkalis are also called	
Sodium hydroxide	NaOH			
Potassium hydroxide	КОН	ALKALIS	SOLUBLE BASES	
Calcium hydroxide Ca(OH) <sub>2</sub>				
Aqueous ammonia	NH <sub>4</sub> OH	Alkalis are categorized into STRONG and WEAK alkalis		

### Definition of alkalis;

Alkalis are substances which when dissolved in water produce hydroxide ions as the only negatively charged ions.

#### **TYPES OF ALKALIS**

STRONG ALKALIS	WEAK ALKALIS		
These are electrovalent compounds that completely ionize in	These are covalent compounds that partly ionize in aqueous		
both aqueous solution and in solid state.	solution and their ionization is reversible.		
Examples of strong alkalis	Example of weak alkalis		
1. Sodium hydroxide solution	1. Aqueous ammonia		
$NaOH_{(aq)} \longrightarrow Na^+_{(aq)} + \overline{O}H_{(aq)}$	It is also called <i>ammonia solution</i>		
2. Potassium hydroxide solution	Aqueous ammonia is also called <i>ammonium hydroxide solution</i>		
$KOH_{(aq)} \longrightarrow K^{+}_{(aq)} + \overline{O}H_{(aq)}$			
3. Calcium hydroxide solution	$NH_{3(g)}$ + $H_2O_{(l)}$ = $NH_4^+_{(aq)}$ + $\bar{O}H_{(aq)}$		
$Ca(OH)_{2(aq)} \longrightarrow Ca^{2+}_{(aq)} + 2\overline{O}H_{(aq)}$			

PROPERTIES OF ALKALIS				
Physical properties Chemical properties				
Have a bitter taste  React with acids to form a salt and water only $NaOH_{(aq)} + HCl_{(aq)} \longrightarrow NaCl_{(aq)} + H_2O_{(l)}$				
Have a soapy feeling to touch	Alkalis precipitate insoluble metallic hydroxides from solutions of			
Change colours of indicators	their salts.			
Form colourless solutions	$2\text{NaOH}_{(aq)} + \text{Pb(NO}_3)_{2(aq)} \longrightarrow \text{Pb(OH)}_{2(s)} + 2\text{NaNO}_{3(aq)}$			

# **COLOUR OF METAL HYDROXIDES**

Metal hydroxide	Colour		
Potassium hydroxide	White		
Sodium hydroxide	White		
Calcium hydroxide	White		
Magnesium hydroxide	White		
Zinc hydroxide	White		
Aluminium hydroxide	White		
Lead (ii) hydroxide	White		
Copper (ii) hydroxide	Blue		
Iron (ii) hydroxide	Green		
Iron (iii) hydroxide	Brown		

# pH SCALE OF ACIDITY AND ALKALINITY

pH scale	pH is related to	pH number
Is a scale of numbers from 1 to 14, to	HYDROGEN ION concentration in	Is a measure of the hydrogen ion
express acidity and alkalinity	solution	concentration

APPROXIMATE pH VALUES OF COMMON SOLUTIONS					
pH 1	рН 2 – рН б	pH 7	pH 8 – pH 13	pH 14	
Strong acid	Weak acid	Neutral	Weak alkali	Strong alkali	
Dilute sulphuric acid Lemon juice (pH 2) Sodium chloride Baking powder (pH 9) Sodium hydroxide					
Dilute nitric acid	Sour milk (pH 5)	Pure water	Wood ash (pH 10)	Potassium hydroxide	

NOTE	Acidic solutions have pH values less than seven. The smaller the pH value, the more acidic the solution is ie the larger
1	the concentration of hydrogen ions.
NOTE	When distilled water is added to an acid, the pH value of the acid increases towards seven. The solution becomes less
2	acidic.
NOTE	Water and other solutions have a pH of seven.
3	
NOTE	Any solution of pH greater than seven is alkaline. The higher the pH value, the more alkaline the solution is ie the
4	larger the concentration of hydroxyl or hydroxide ions.
NOTE	When distilled water is added to an alkaline solution, the pH value of the alkali decreases towards seven. The solution
5	becomes less alkaline.

#### UNIVERSAL INDICATOR

Definition	Forms in which universal indicator occurs	Uses of universal indicator
Universal indicator is a mixture of	✓ In solution form	Determines whether the solution is acidic or
indicators.	✓ In paper form	alkaline.
		Used to determine the degree of acidity and
		alkalinity.

pH scale	1 -2	3	4	5	6 - 8	9 - 10	11 - 12	13 - 14
Colour	Red	Pink	Brown	Yellow	Green	Blue	Indigo	Violet

# SIGNIFICANCE OF PH MEASUREMENTS

- 1. It helps to know that the final product in soap industry is neutral.
- 2. Too acidic soils are harmful in agriculture, and this can be determined by measuring the pH of the soil.
- 3. Various drugs are prepared at pHs which must be determined

#### **SALTS**

DEFINITION OF SALT	TYPES OF SALTS		
A salt is a substance formed when <u>all</u> or <u>part</u> of the replaceable hydrogen of an acid is replaced by a metal or metallic radical.	Acid salts	Normal salts	

Definition of normal salt	Definition of acid salt
A normal salt is a salt formed when <u>all</u> the replaceable hydrogen	An acid salt is a salt formed when <u>part</u> of the replaceable
of an acid is replaced by a metal or metallic radical.	hydrogen of an acid is replaced by a metal or metallic radical.
Examples of normal salts	Examples of acid salts
✓ Sodium sulphate	✓ Calcium hydrogencarbonate
✓ Sodium carbonate	✓ sodium hydrogencarbonate
✓ Potassium nitrate	✓ Calcium hydrogensulphate
✓ Potassium sulphate	✓ Potassium hydrogencarbonate
✓ Calcium nitrate	✓ Calcium hydrogenphosphate
✓ Aluminium sulphate	✓ Magnesium hydrogencarbonate
Formation of a normal salt	Formation of an acid salt
Zinc granules reacting with dilute sulphuric acid.	Sodium chloride reacting with concentrated sulphuric acid.
$Zn_{(s)}$ + $H_2SO_{4(aq)}$ $ZnSO_{4(aq)}$ + $H_{2(g)}$	$H_2SO_{4(l)} + NaCl_{(s)} \longrightarrow NaHSO_{4(aq)} + HCl_{(g)}$

STATEMENT(S)		REASON(S)
Monobasic acids do not form acid salts	BECAUSE	Monobasic acids contain only one atom of replaceable
		hydrogen per acid molecule.
Sodium ethanoate, CH <sub>3</sub> COONa is a normal salt.	BECAUSE	The hydrogen it contains does not form ions and cannot be
		replaced by a metal

TYPES OF SALTS AND ACIDS FROM WHICH THEY ARE FORMED				
ACID	TYPE OF SALT	EXAMPLE OF THE SALT		
Sulphuric acid	Sulphates	Iron (ii) sulphate		
Hydrochloric acid	Chlorides	Sodium chloride		
Carbonic acid	Carbonates	Potassium carbonate		
Nitric acid	Nitrates	Calcium nitrate		
Sulphuric acid	hydrogencarbonates	Sodium hydrogencarbonate		

CATEGORIZING SALTS DEPENDING ON THEIR SOLUBILITY IN WATER

PREPARATION OF SOLUBLE SALTS BY							
1. ACTION OF AN ACID ON A METAL							
General equation	Metal	+	Acid –	<b>———</b>	Salt	+	Hydrogen
This method is not suitable for	ı			The metals of potassi	•	ım and	calcium react
preparation of salts of highly	ı			explosively with dilut	e acids		
reactive metals for example;	. 5		HOD				
• Potassium	В.	ECA	AUSE				
• Sodium	ı						
• Calcium	1	C 1					
This method is only used to prepare	e saits o	i ies	ss reactive r	netals such as			
<ul><li> Aluminium</li><li> Zinc</li></ul>							
<ul><li>Zinc</li><li>Magnesium</li></ul>							
<ul><li>Magnesium</li><li>Iron</li></ul>							
Magnesium sulphate can be prepar	ed by 119	sino	magnesiıır	n and dilute sulphuric	acid		
	MgSO <sub>4(a</sub>	_	$+ H_{2(g)}$	ir aira airate baipiraire	acia		
Iron (ii) sulphate can be prepared b			(0)	l dilute sulphuric acid			
$Fe_{(s)}$ + $H_2SO_{4(aq)}$ $\longrightarrow$ $FeSO_{4(aq)}$ + $H_{2(g)}$							
EXPERIMENT: Preparation of zinc sulphate crystals							
✓ Dilute sulphuric acid is poured in a beaker and granulated zinc is added.							
✓ Effervescence occurs							
$\checkmark$ If the reaction is slow, a little co	pper (ii)	sulp	phate soluti	on is added as a catal	yst and th	ie react:	ants are warmed
gently.							
$Zn_{(s)}$ + $H_2SO_{4(aq)}$	→ ZnS	O <sub>4(a</sub>	(p) + H	2(g)			
$\checkmark$ When the reaction stops, more z	inc is ac	ldec	d to make s	ure that the acid is no	t left in co	onsidera	ıble amounts.
✓ Excess zinc granules are filtered off.							
✓ The filtrate is gently heated in an evaporating dish to boil off some water until crystals begin to form, when the			o form, when the				
filtrate cools, on a glass rod, which is dipped into the filtrate at regular intervals.							
✓ The crystals are filtered off and t	then pre	sse	d gently bet	ween filter papers to d	lry.		

#### PREPARATION OF SOLUBLE SALTS BY 2. ACTION OF AN ACID ON SOLUBLE HYDROXIDE OR CARBONATE This method is used to prepare salts of potassium, sodium and ammonium PREPARATION OF; (i) Potassium chloride KOH<sub>(aq)</sub> $HCl_{(aq)}$ $KCl_{(aq)}$ $H_2O_{(1)}$ $K_2CO_{3(aq)}$ $2HCl_{(aq)}$ $H_2O_{(1)}$ $CO_{2(g)}$ $KCl_{(aq)}$ Sodium nitrate (ii) NaOH<sub>(aq)</sub> HNO<sub>3(aq)</sub> NaNO<sub>3(aq)</sub> $H_2O_{(1)}$ Na<sub>2</sub>CO<sub>3(aq)</sub> 2HNO<sub>3(aq)</sub> NaNO<sub>3(aq)</sub> $H_2O_{(1)}$ + $CO_{2(g)}$ (iii) Ammonium chloride NH<sub>4</sub>OH<sub>(aq)</sub> $HCl_{(aq)}$ $NH_4Cl_{(aq)}$ $H_2O_{(1)}$ $(NH_4)_2CO_{3(aq)} + 2HCl_{(aq)}$ $2NH_4Cl_{(aq)}$ $CO_{2(g)}$ $H_2O_{(1)}$ + (iv) Ammonium sulphate 2NH<sub>4</sub>OH<sub>(aq)</sub> $H_2SO_{4(aq)}$ (NH<sub>4</sub>)<sub>2</sub>SO<sub>4(aq)</sub> $H_2O_{(1)}$ $(NH_4)_2CO_{3(aq)} + H_2SO_{4(aq)}$ (NH<sub>4</sub>)<sub>2</sub>SO<sub>4(aq)</sub> $H_2O_{(1)}$ $CO_{2(g)}$

# EXPERIMENT: <u>Preparation of sodium sulphate crystals</u>

- ✓ A known volume of sodium hydroxide solution is pipetted into a conical flask and 2 drops of phenolphthalein added.
- ✓ Dilute sulphuric acid is added from the burette to conical flask at intervals until the colour of the indicator changes to pink.

$$2NaOH_{(aq)}$$
 +  $H_2SO_{4(aq)}$  -  $Na_2SO_{4(aq)}$  +  $2H_2O_{(l)}$ 

- ✓ Having noted the volume of the acid used, the solution is poured away as the indicator would colour the salt obtained from it.
- ✓ The whole process is repeated using the same volume of the solution of sulphuric acid and sodium hydroxide solution without adding the indicator.
- ✓ The solution is evaporated until it forms crystals when it cools, on a clean glass rod, which is dipped into the solution at regular intervals.
- ✓ The crystals are filtered off and then pressed gently between filter papers to dry.

	PREPARATION OF SOLUBLE SALTS BY				
3. ACTION OF A	N ACID ON INS	SOLUBLE OXIDES OR HYD	ROXIDES		
This method is used	to prepare Mag	gnesium sulphate, zinc sulpl	hate and lead (ii)	nitrate	
PREPARATION OF;	(i) Magne	sium sulphate			
	MgO <sub>(s)</sub> +	$H_2SO_{4(aq)}$	$MgSO_{4(aq)}$ +	$H_2O_{(l)}$	
	$Mg(OH)_{2(s)}$ +	$H_2SO_{4(aq)}$	MgSO <sub>4(aq)</sub> +	$H_2O_{(l)}$	
	(ii) Zinc si	ulphate			
	$ZnO_{(s)}$ +	$H_2SO_{4(aq)}$	$ZnSO_{4(aq)}$ +	$\mathrm{H}_{2}\mathrm{O}_{(\mathrm{l})}$	
	$Zn(OH)_{2(s)}$ +	$H_2SO_{4(aq)}$	$ZnSO_{4(aq)}$ +	$H_2O_{(l)}$	
	(iii) Lead (i	ii) nitrate			
	PbO <sub>(s)</sub> +	HNO <sub>3(aq)</sub>	$Pb(NO_3)_{2(aq)}$ +	$\mathrm{H}_{2}\mathrm{O}_{(\mathrm{l})}$	
	$Pb(OH)_{2(s)}$ +	HNO <sub>3(aq)</sub>	$Pb(NO_3)_{2(aq)}$ +	$H_2O_{(1)}$	

### EXPERIMENT: <u>Preparation of copper (ii) sulphate crystals</u>

- ✓ Copper (ii) oxide is added to a beaker of warm dilute sulphuric acid and the mixture stirred gently.
- ✓ More of the oxide is added, little at a time until no more reacts, showing that all the acid has been neutralized.
  - $CuO_{(s)}$  +  $H_2SO_{4(aq)}$   $CuSO_{4(aq)}$  +  $H_2O_{(l)}$
- ✓ Excess copper (ii) oxide is filtered off and the filtrate evaporated until crystals begin to form when it cools, on a clean glass rod, which is dipped into the filtrate at regular intervals
- ✓ The crystals are filtered off and then pressed gently between filter papers to dry.

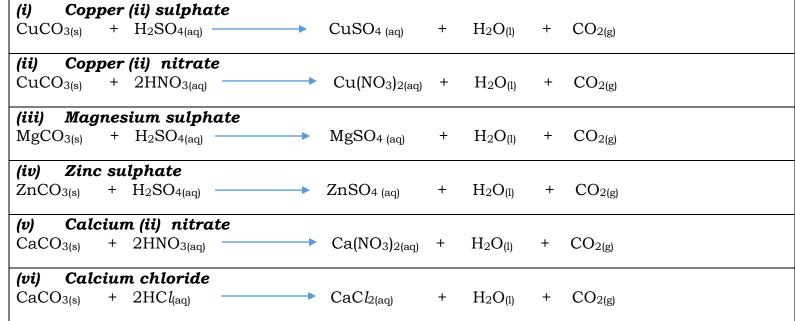

#### PREPARATION OF SOLUBLE SALTS BY

#### 4. ACTION OF AN ACID ON SOLUBLE INSOLUBLE CARBONATES

The salts of copper (ii) sulphate, copper (ii) nitrate, magnesium sulphate, zinc sulphate, calcium chloride and calcium nitrate are prepared by this method.

Calcium chloride and calcium nitrate are deliquescent and do not form crystals. Their solutions must be evaporated to dryness

PREPARATION OF:

# EXPERIMENT: Preparation of lead (ii) nitrate crystals

- ✓ Lead (ii) carbonate is added little at a time to dilute nitric acid in a beaker.
- ✓ Effervescence occurs as carbon dioxide is evolved.
- ✓ More carbonate is added until no more reacts, showing that all the acid has reacted.

- ✓ The excess carbonate is filtered off and the filtrate evaporated until crystals begin to form when it cools, on a clean glass rod, which is dipped into the filtrate at regular intervals.
- ✓ The crystals are filtered off and then pressed gently between filter papers to dry.

5. PREPARATION OF SALTS BY DIRECT SYNTHESIS		
Salts to which this method applies	APPLIES to both <u>soluble</u> and <u>insoluble</u> salts	
Another name for this method	Direct synthesis	
Salts prepared by direct synthesis	Used to prepare binary salts, for example;	
	✓ Chlorides eg anhydrous iron (iii) chloride	
	✓ Bromides eg aluminium bromide	
	✓ Sulphides eg iron (ii) sulphide	
Definition of direct synthesis	Direct synthesis is the method of preparing soluble and insoluble salts	
	directly from their elements.	

PREPARATION OF ANHYDROUS IRON (III) CHLORIDE			
Conditions for the reaction   • Dry chlorine gas			
	<ul> <li>Heating is required</li> </ul>		
Equation for the reaction	$2Fe_{(s)} + 3Cl_{2(g)} \longrightarrow 2FeCl_{3(s)}$		
Colour of iron (iii) chloride	BROWN		

PREPARATION OF ALUMINIUM CHLORIDE		
Conditions for the reaction   • Dry chlorine gas		
	<ul> <li>Heating is required</li> </ul>	
Equation for the reaction	$2Al_{(s)} + 3Cl_{2(g)} \longrightarrow 2AlCl_{3(s)}$	
Colour of aluminium chloride	WHITE	

PREPARATION OF IRON (II) SULPHIDE			
Conditions for the reaction	Heating is required		
Observation made	The mixture glows when heated forming a black solid.		
Equation for the reaction	$Fe_{(s)} + S_{(g)} \longrightarrow FeS_{(s)}$		
Colour of iron (ii) sulphide	BLACK		

6. PREPARATION OF INSOLUBLE	E SALTS BY PRECIPITATION		
Method also called	Double decomposition reaction		
What is involved in this method?	In this method, two soluble salts are mixed together to give a mixture of a		
	soluble salt and an insoluble salt (precipitate)		
PREPARATION OF	(i) Barium sulphate		
	$BaCl_{2(aq)}$ + $Na_2SO_{4(aq)}$ $\longrightarrow$ $BaSO_{4(s)}$ + $2NaCl_{(aq)}$		
	(ii) Lead (ii) chloride (It is soluble in hot water)		
	$Pb(NO_3)_{2(aq)} + NaCl_{(aq)} \longrightarrow PbCl_{2(s)} + 2NaNO_{3(aq)}$		
	(iii) Calcium carbonate		
	$CaCl_{2(aq)}$ + $Na_2CO_{3(aq)}$ — CaCO <sub>3(s)</sub> + $2NaCl_{(aq)}$		
	(iv) Lead (ii) bromide		
	$Pb(NO_3)_{2(aq)}$ + $2NaBr_{(aq)}$ Pb $Br_{2(s)}$ + $2NaNO_{3(aq)}$		
	(v) Calcium sulphate		
	$Ca(NO_3)_{2(aq)}$ + $Na_2SO_{4(aq)}$ $\longrightarrow$ $CaSO_{4(s)}$ + $2NaNO_{3(aq)}$		
	(v) Calcium sulphate $Ca(NO_3)_{2(aq)}$ + $Na_2SO_{4(aq)}$ $\longrightarrow$ $CaSO_{4(s)}$ + $2NaNO_{3(aq)}$		

# EXPERIMENT: Preparation of lead (ii) sulphate crystals

- ✓ Dilute sulphuric acid is added to warm lead (ii) nitrate solution in a beaker and the mixture is stirred.
- ✓ The white precipitate formed is heated to enable rapid filtration.
- ✓ After filtration, the precipitate is washed several times with hot distilled water to remove soluble impurities.
- $\checkmark$  The precipitate is allowed to dry on a filter paper.

$$Pb(NO_3)_{2(aq)} + H_2SO_{4(aq)} \longrightarrow PbSO_{4(s)} + 2HNO_{3(aq)}$$

NOTE; SODIUM SULPHATE solution may be used instead of SULPHURIC ACID

$$Pb(NO_3)_{2(aq)} + Na_2SO_{4(aq)} \longrightarrow PbSO_{4(s)} + 2NaNO_{3(aq)}$$

# HYDROLYSIS OF SALTS

Why does a solution of potassium carbonate	This is because when in aqueous solution, potassium carbonate
show basic characteristics?	hydrolyses in water to form a mixture of a strong alkali (KOH) and a weak
	acid (H <sub>2</sub> CO <sub>3</sub> ). The resultant solution is alkaline because the concentration
	of hydroxyl ions from the strong alkali is greater than the concentration
	of hydrogen ions from the weak acid.
	The strong alkali completely ionizes in solution and the weak acid under
	goes incomplete ionization.
Equation for the reaction	$  K_2CO_{3(s)} + 2H_2O_{(l)} \longrightarrow 2KOH_{(aq)} + H_2CO_{3(aq)}$

Why does a solution of ammonium chloride show acidic characteristics?	This is because when in aqueous solution, ammonium chloride hydrolyses in water to form a mixture of a strong acid (HCl) and a weak alkali (NH <sub>4</sub> OH). The resultant solution is acidic because the concentration of hydrogen ions from the strong acid is greater than the concentration of hydroxyl ions from the weak alkali.  The strong acid completely ionizes in solution and the weak alkali under goes incomplete ionization.
Equation for the reaction	NH <sub>4</sub> C $l_{(s)}$ + 2H <sub>2</sub> O <sub>(l)</sub> $\longrightarrow$ NH <sub>4</sub> OH <sub>(aq)</sub> + HC $l_{(aq)}$

# REACTIONS FOR IONIC SALTS

When an ionic salt dissolves in water, its ions separate into free ions. For example; when zinc sulphate is dissolved in water, zinc ions  $(Zn^{2+})$  and sulphate ions  $(SO_4^{2+})$ 

# **IONIC EQUATIONS**

Ionic equations describe chemical changes by showing only the reacting ions.

Three steps are followed when writing ionic equations;

STEP 1	Write the formal equation.
STEP 2	Write down all the ions in the equation.
STEP 3	The ionic equation is written by omitting the identical ions which appear on both sides of the equation.

# Important notes to take;

NOTE 1	Gases do not ionize.
NOTE 2	Solids do not ionize. (Precipitates do not ionize)
NOTE 3	Water does not ionize.
NOTE 4	Only aqueous solutions ionize.

#### **EXERCISE**

Write ionic equations for the following reactions

- i) Copper (ii) sulphate solution is added to sodium carbonate solution
- ii) Sodium hydroxide solution is added to lead (ii) nitrate solution
- iii) Zinc powder is added to copper (ii) sulphate solution
- iv) Chlorine gas is passed through a solution of iron (ii) chloride
- *v)* Dilute hydrochloric acid is added to solid calcium carbonate
