## Motion in straight line

### Distance and displacement

Distance is a length between 2 fixe points

Displacement is the distance covered in a specific direction

### Speed and velocity

Speed is the rate of change of distance with time

Velocity is the rate of change of displacement with time

$$\text{Average speed} = \frac{\text{total distance}}{\text{total time taken}}$$

$$\text{Average velocity} = \frac{\text{total displacement}}{\text{total time taken}}$$

#### Example 1

Find the distance travelled in 5s by a body moving with a constant speed of  $3.2\text{ms}^{-1}$

Solution

$$\text{Average speed} = \frac{\text{total distance}}{\text{total time taken}} \quad \left| \quad 3.2 = \frac{\text{total distance}}{5} \quad \right| \quad \text{distance} = 16\text{m}$$

#### Example 2

John ran 1500m in 3minutes and 33s, find his average speed.

$$\text{Average speed} = \frac{\text{total distance}}{\text{total time taken}} \quad \left| \quad \text{speed} = \frac{1500}{(3 \times 60 + 33)} = 7.04\text{ms}^{-1} \right.$$

## Acceleration

It is the rate of change of velocity

$$\text{Acceleration} = \frac{\text{change in velocity}}{\text{total time taken}} \quad \left| \quad a = \frac{v-u}{t} \text{ where } v = \text{final velocity, } u = \text{initial velocity, } t = \text{time} \right.$$

### Uniform acceleration

This is the constant rate of change of velocity with time

## Equations of uniform acceleration

### 1<sup>st</sup> equation

Suppose a body moving in a straight line with uniform acceleration  $a$ , increases its velocity from  $u$  to  $v$  in time  $t$ , then from the definition of acceleration

$$a = \frac{v-u}{t} \quad \left| \quad at = v - u \quad \right| \quad \left| \quad \mathbf{v = u + at} \dots\dots\dots 1 \right.$$

### 2<sup>nd</sup> equation

Suppose an object with velocity  $u$  moves with uniform acceleration  $a$  time  $t$  and attains a velocity  $v$ , the distance  $s$  travelled by the object is given by:  $s = \text{average velocity} \times \text{time}$

$$s = \left(\frac{v+u}{2}\right)t \text{ but } v = u + at \quad \left| \quad s = \left(\frac{2ut+at^2}{2}\right) \right.$$
$$s = \left(\frac{u+u+at}{2}\right)t \quad \left| \quad \mathbf{s = ut + \frac{1}{2}at^2} \dots\dots\dots 2 \right.$$

### 3<sup>rd</sup> equation

$s = \text{average velocity} \times \text{time}$

$$s = \left(\frac{v+u}{2}\right)t \text{ but } t = \frac{v-u}{a} \quad \left| \quad s = \left(\frac{v^2-u^2}{2a}\right) \right.$$
$$s = \left(\frac{v+u}{2}\right)\left(\frac{v-u}{a}\right) = \quad \left| \quad \mathbf{v^2 = u^2 - 2as} \dots\dots\dots 3 \right.$$

### Example 3

A car is initially at rest at a point O. The car moves from O in a straight line with an acceleration of  $4\text{ms}^{-2}$ . find how far the car

(i) is from O after 2s

$$\text{From } \mathbf{s = ut + \frac{1}{2}at^2}; \quad \mathbf{s = 0 \times 2 + \frac{1}{2} \times 4 \times 2^2 = 8\text{m}}$$

(ii) is from O after 3s

$$\mathbf{s = 0 \times 2 + \frac{1}{2} \times 4 \times 2^2 = 18\text{m}}$$

(iii) distance travelled in the third second =  $18 - 8 = 10\text{m}$

### Example 4

A body at O moving with a velocity  $10\text{ms}^{-2}$  decelerates at  $2\text{ms}^{-2}$ .

(a) find the displacement of the body from O after 7s

$$\text{From } \mathbf{s = ut + \frac{1}{2}at^2}$$
$$\mathbf{s = 10 \times 7 + \frac{1}{2} \times -2 \times 7^2 = 21\text{m}}$$

(b) how far from O does the body come to rest and how long does it take

$$\mathbf{s = \left(\frac{v^2-u^2}{2a}\right) = \frac{0^2-10^2}{2 \times -2} = 25\text{m}}$$
$$\mathbf{t = \frac{v-u}{a} = \frac{0-10}{-2} = 5\text{s}}$$

### Example 5

A taxi approaching a stage runs two successive half kilometres in 16s and 20s respectively. Assuming the retardation is uniform, find

- (i) Initial speed of the taxi

$$s = ut + \frac{1}{2}at^2$$

For the first half kilometre or 500m

$$500 = 16u + \frac{1}{2}a(16)^2 \dots\dots\dots (i)$$

for the kilometre or 1000m

$$1000 = 36u + \frac{1}{2}a(36)^2 \dots\dots\dots (ii)$$

from eqn. (i) and eqn. (ii)

$$a = \frac{25}{72} \text{ and } u = 34.028\text{ms}^{-1}$$

- (ii) the further distance, the taxi runs before stopping

$$s = \left( \frac{v^2 - u^2}{2a} \right) = s = \left( \frac{0^2 - (34.028)^2}{2\left(\frac{25}{72}\right)} \right) = 1667.3\text{m}$$

$$\text{Extra distance} = 1667.3 - 1000 = 667.3\text{m}$$

### Example 6

An overloaded taxi travelling at constant velocity of 90km/h overtakes a stationary traffic police car. 2s later, the police car sets in pursuit, accelerating at a uniform rate of 6ms<sup>-2</sup>. How far does the traffic car travel before catching up with the taxi?

Solution

t<sub>1</sub> = time taken by the taxi

t<sub>2</sub> = time taken by the police car

$$t_1 = 2 + t_2$$

speed of the taxi in m/s

$$90\text{km/h} = \frac{90 \times 1000}{3600} = 25\text{ms}^{-1}$$

$$s = ut + \frac{1}{2}at^2$$

$$s_T = 25t_1$$

$$s_C = 0 \times t_2 + \frac{1}{2} \times 6 \times t_2^2 = 3t_2^2$$

For the car to catch taxi; s<sub>T</sub> = s<sub>C</sub>

$$25t_1 = 3t_2^2$$

$$25(2 + t_2) = 3t_2^2$$

$$t = 10\text{s} \text{ or } t = \frac{4}{3}\text{s}$$

the car leaves 2s later then 10s is the correct time since it gives positive distance

$$s_C = 3t_2^2 = 3 \times 10^2 = 300\text{m}$$

### Example 7

A lorry starts from a point A and moves along a straight horizontal road with a constant acceleration of 2ms<sup>-2</sup>. At the same time a car moving with a speed of 20ms<sup>-1</sup> and a constant acceleration of 3ms<sup>-1</sup> is 400m behind the point A and moving in the same direction as the lorry. find:

- (a) how far from A the car overtakes the lorry.  
a car over takes the lorry; both move in the same time, t

$$s = ut + \frac{1}{2}at^2$$

distance moved by the car = 400 + distance moved by the lorry

$$20t + \frac{1}{2} \times 3 \times t^2 = 400 + \frac{1}{2} \times 2 \times t^2$$

$$t^2 + 40t - 800 = 0; t = 14.64s \text{ or } t = -54.64s$$

Hence  $t = 14.64s$

$$sL = \frac{1}{2} \times 2 \times (14.64)^2 = 214.33m$$

(b) the speed of the lorry when it is being overtaken

$$v = u + at$$

$$= 0 + 2 \times 14.64 = 29.28ms^{-1}$$

### Example 8

The speed of a taxi decreases from  $90kmh^{-1}$  to  $18kmh^{-1}$  in a distance of 120 metres. Find the speed of the taxi when it had covered a distance of 50metres. (05marks)

$$\text{Given } u = 90kmh^{-1}, v = 18kmh^{-1}, s = 120m = 0.12km$$

$$\text{Using } v^2 = u^2 + 2as$$

$$18^2 = 90^2 + 2a(0.12)$$

$$a = -32400kmh^{-2}$$

$$\text{When } s = 50m = 0.05km, u = 90kmh^{-1}, a = -32400kmh^{-2}$$

$$\text{Using } v^2 = u^2 + 2as$$

$$v^2 = 90^2 - 2 \times 32400 \times 0.05 = 4860$$

$$v = \sqrt{4860} = 69.71kmh^{-1}$$

### Example 9

(a) Show that the final velocity  $v$  of a body which starts with an initial velocity  $u$  and moves with uniform acceleration  $a$  consequently covering a distance  $x$ , is given by  $v = [u^2 + 2ax]^{\frac{1}{2}}$

$x = \text{average velocity} \times \text{time}$

$$x = \left(\frac{v+u}{2}\right)t \text{ but } t = \frac{v-u}{a}$$

$$x = \left(\frac{v+u}{2}\right)\left(\frac{v-u}{a}\right) = \left(\frac{v^2-u^2}{2a}\right)$$

$$v^2 = u^2 + 2ax$$

$$v = [u^2 + 2ax]^{\frac{1}{2}}$$

(b) Find the value of  $x$  in (a) if  $v = 30m/s$ ,  $u = 10m/s$  and  $a = 5m/s^2$

$$30 = [10^2 + 2 \times 5x]^{\frac{1}{2}}$$

$$900 = 100 + 10x$$

$$x = 80m$$

## Velocity-time graphs

### Example 10

A car started from rest and attained a velocity of 20m/s in 40s. It then maintained the velocity attained for 50s. After that it was brought to rest by a constant braking force in 20s.

- (i) Draw a velocity-time graph for the motion

- (ii) using the graph, find the total distance travelled by the car  
Total distance = total area under the graph

$$\begin{aligned} &= \frac{1}{2}bh + lw + \frac{1}{2}bh \\ &= \frac{1}{2} \times 40 \times 20 + 50 \times 20 + \frac{1}{2} \times 20 \times 20 = 1600\text{m} \end{aligned}$$

Method II (area of a trapezium)

$$A = \frac{1}{2}h(a + b) = \frac{1}{2} \times 20(50 + 110) = 1600\text{m}$$

- (iii) what is the acceleration of the car?

$$a = \frac{v-u}{t} = \frac{20-0}{40} = 0.5\text{ms}^{-2}$$

### Example 11

A car from rest accelerates steadily to 10s up to a velocity of 20ms. It continues with uniform velocity for further 20s and then decelerates so that it stops in 20s.

- (a) Draw a velocity-time graph to represent the motion

- (b) Calculate

- (i) acceleration

$$a = \frac{v-u}{t} = \frac{20-0}{10} = 2\text{ms}^{-2}$$

- (ii) deceleration

$$a = \frac{v-u}{t} = \frac{0-20}{20} = -1\text{ms}^{-2}$$

- (i) Distance = area under the graph

$$\begin{aligned} A &= \frac{1}{2} \times 10 \times 20 + 20 \times 20 + \frac{1}{2} \times 20 \times 20 \\ &= 700\text{m} \end{aligned}$$

Method II (area of a trapezium)

$$A = \frac{1}{2} \times 20(50 + 20) = 700\text{m}$$

$$\begin{aligned} \text{Average speed} &= \frac{\text{distance}}{\text{time}} \\ &= \frac{700}{50} = 14\text{m/s} \end{aligned}$$

### Example 12

The graph below shows the motion in the body.

(a) Describe the motion of the body

A body with initial velocity of 15m/s accelerates steadily to a velocity of 20m/s in 4s, it then continues with a uniform velocity for 6s and brought to rest in 2s.

(b) Calculate the total distance travelled

$$\text{Distance} = 4 \times 15 + \frac{1}{2} \times 4 \times 5 + 20 \times 6 + \frac{1}{2} \times 20 \times 2 = 210\text{m}$$

### Revision exercise

- P, Q and R are points on a straight road such that PQ = 20m and QR = 55m. A cyclist moving with uniform acceleration passes O and then notices that it takes him 10s and 15s to travel between P and Q and Q and R respectively. find the acceleration [  $a = \frac{2}{15} \text{ms}^{-2}$  ]
- A car travels from Kampala to Jinja and back. It takes average speed on the return journey is 4km/h greater than that on the outward journey and it takes 12 minutes less. Given that Kampala and Jinja are 80km apart, find the average speed on the outward journey. [30.05kmh]
- Car A traveling at  $35\text{ms}^{-1}$  along a straight horizontal road, accelerates uniformly at  $0, 4\text{ms}^{-2}$ . At the same time, another car B moving at  $44\text{ms}^{-1}$  and accelerating uniformly at  $0.5\text{ms}^{-2}$  is 200m behind A
  - Find the time taken before car B over takes car A. [20s]
  - speed with which B over takes A. [55m/s]
- A car is being driven along a road at  $72\text{kmh}^{-1}$  notices a fallen tree on the road 800m ahead and suddenly reduces the speed to  $36\text{kmh}^{-1}$  by applying brakes. For how long were the brakes applied [53.33s]
- A train starts from station a with a uniform acceleration of  $0.2\text{ms}^{-2}$  for 2 minutes and attains a maximum speed and moves uniformly for 15 minutes. it is then brought to rest at constant retardation of  $5/3\text{ms}^{-2}$  at station B. find the distance between A and B. [23212.8m]
- A motorcycle decelerated uniformly from  $20\text{kmh}^{-1}$  to  $8\text{kmh}^{-1}$  in travelling 896m. find the rate of deceleration in  $\text{ms}^2$  [0.0145 $\text{ms}^{-2}$ ]
- A body moves with a uniform acceleration and covers a distance of 27m in 3s; it then moves with a uniform velocity and covers a distance of 60m in 5s. Find the initial velocity and acceleration of the body. [ $6\text{ms}^{-1}$ ,  $2\text{ms}^{-2}$ ]
- A particle is projected away from an origin O with initial velocity of  $0.25\text{ms}^{-1}$ . The particle travels in a straight line and accelerates at  $1.5\text{ms}^{-2}$ . find
  - how far the particle is from O after 4s [7.5m]
  - the distance travelled by the particle during the fourth second after projection. [5.5m]
- A taxi which is moving with a uniform acceleration is observed to take 20s and 30s to travel successive 400m. find
  - initial speed of the taxi. [ $\frac{68}{3} \text{ms}^{-1}$ ]

- (ii) the further distance it covers before stopping [163.3m]
10. Two cyclist A and B are 36m apart on a straight road. Cyclist B starts from rest with an acceleration of  $6\text{ms}^{-2}$  while A is in pursuit of B with velocity of  $20\text{ms}^{-1}$  and acceleration of  $4\text{ms}^{-1}$ . Find the time taken when A overtakes B [13466s]

Thank You

Dr. Bbosa Science
