## Linear momentum

This is the product of mass of a body and its velocity.  
 Momentum = mass x velocity

## Collisions

### Case 1: bodies separate after collision

Consider two bodies A and B with body A having a mass of  $M_A$ , initial velocity  $U_A$ , and body B having a mass  $M_B$ , initial velocity  $U_B$ , after collision body A has a final velocity  $V_A$  and body B has a final velocity  $V_B$ .

$$M_A U_A + M_B U_B = M_A V_A + M_B V_B$$

$$\text{Loss in k.e} = \left( \frac{1}{2} M_A U_A^2 + \frac{1}{2} M_B U_B^2 \right) - \left( \frac{1}{2} M_A V_A^2 + \frac{1}{2} M_B V_B^2 \right)$$

$$\% \text{loss in k.e} = \frac{\left( \frac{1}{2} M_A U_A^2 + \frac{1}{2} M_B U_B^2 \right) - \left( \frac{1}{2} M_A V_A^2 + \frac{1}{2} M_B V_B^2 \right)}{\left( \frac{1}{2} M_A U_A^2 + \frac{1}{2} M_B U_B^2 \right)} \times 100\%$$

### Case2: bodies stick together and move with a common velocity after collision

Consider two bodies A and B with body A having a mass of  $M_A$ , initial velocity  $U_A$ , and body B having a mass  $M_B$ , initial velocity  $U_B$ , after collision body A and body B stick together and move with common velocity  $V$ .

$$M_A U_A + M_B U_B = (M_A + M_B) V$$

$$\text{Loss in k.e} = \left( \frac{1}{2} M_A U_A^2 + \frac{1}{2} M_B U_B^2 \right) - \left( \frac{1}{2} (M_A + M_B) V^2 \right)$$

$$\% \text{loss in k.e} = \frac{\left( \frac{1}{2} M_A U_A^2 + \frac{1}{2} M_B U_B^2 \right) - \left( \frac{1}{2} (M_A + M_B) V^2 \right)}{\left( \frac{1}{2} M_A U_A^2 + \frac{1}{2} M_B U_B^2 \right)} \times 100\%$$

### Example 1

A trolley of mass 3kg travelling at a velocity of  $4\text{ms}^{-1}$  collide with another trolley of mass 1kg which is at rest. At what velocity do the two bodies move together after collision?

$$M_A U_A + M_B U_B = (M_A + M_B) V$$

$$(3 \times 4) + (1 \times 0) = (3 + 1) V$$

$$12 = 4V$$

$$V = 3\text{ms}^{-1}$$

### Example 2

An object of mass 10kg collides with a stationary object of mass 5kg. If the objects stick together and move forward with a velocity of  $4\text{ms}^{-1}$ . What was original velocity of the moving objects?

$$M_A U_A + M_B U_B = (M_A + M_B) V$$

$$(10 \times U) + (5 \times 0) = (10 + 5) \times 4$$

$$U = 60 \text{ms}^{-1}$$

**Example 3**

Two bodies of masses 200kg and 100kg travel towards each other with velocities of  $20 \text{ms}^{-1}$  and  $25 \text{ms}^{-1}$  respectively and join to form one body on collision. Find the common velocity.

$$M_A U_A + M_B U_B = (M_A + M_B) V$$

$$(200 \times 20) + (100 \times -25) = (200 + 100) \times v$$

$$V = 5 \text{ms}^{-1}$$

**Example 4**

A particle of mass 2kg moving with a speed  $10 \text{ms}^{-1}$  collides with a stationary particle of mass 7kg. Immediately after impact, the particle moves with the same speed but in opposite directions. Find the loss in kinetic energy

$$M_A U_A + M_B U_B = M_A V_A + M_B V_B$$

$$2 \times 10 + 7 \times 0 = 2 \times -v + 7 \times v$$

$$v = 4 \text{ms}^{-1}$$

$$\text{k.e before} = \frac{1}{2} \times 2 \times 10^2 + \frac{1}{2} \times 7 \times 0^2 = 100 \text{J}$$

$$\text{k.e after} = \frac{1}{2} \times 2 \times 4^2 + \frac{1}{2} \times 7 \times 4^2 = 72 \text{J}$$

$$\text{loss in k.e} = 100 - 72 = 28 \text{J}$$

**Example 5**

Two particles are moving towards each other along a straight line. The first particle has mass of 0.2kg and moving with velocity  $4 \text{ms}^{-1}$  and then the second has a mass of 0.4kg moving with a velocity of  $3 \text{ms}^{-1}$ . On collision, the first particle reverses its direction and moves with a velocity of  $2.5 \text{ms}^{-1}$ . Find the percentage loss in kinetic energy.

$$M_A U_A + M_B U_B = M_A V_A + M_B V_B$$

$$0.2 \times 4 + 0.4 \times -3 = 0.2 \times -2.5 + 0.4 V$$

$$V = 0.25 \text{ms}^{-1}$$

$$\text{k.e before} = \frac{1}{2} \times 0.2 \times 4^2 + \frac{1}{2} \times 0.4 \times 3^2$$

$$= 3.4 \text{J}$$

$$\text{k.e after} = \frac{1}{2} \times 0.2 \times -2.5^2 + \frac{1}{2} \times 0.4 \times 0.25^2$$

$$= 0.6375 \text{J}$$

$$\% \text{ loss in k.e} = \frac{(3.4 - 0.6375)}{3.4} \times 100\% = 81.25\%$$

**Example 6**

A bullet of mass 20g is fired into a block of wood of mass 400g lying on a smooth horizontal surface. If the bullet and the wood move together with the speed of  $20 \text{ms}^{-1}$ . Calculate

(a) the speed with which the bullet hits the wood

$$M_A U_A + M_B U_B = (M_A + M_B) V$$

$$0.02 \times U_A + 0.4 \times 0 = 0.42 \times 20$$

$$U_A = 420\text{ms}^{-1}$$

(b) The kinetic energy loss

$$\text{k.e energy before} = \frac{1}{2} \times 0.02 \times 420^2 = 1764\text{J}$$

$$\text{k.e after} = \frac{1}{2} \times 0.42 \times 20^2 = 84\text{J}$$

$$\text{Loss in k.e} = 1764 - 84 = 1680\text{J}$$

### Example 7

Two bodies A and B of mass 4kg and 3kg moving with velocities  $(2i + 3j)\text{ms}^{-1}$  and  $(5i - 6j)\text{ms}^{-1}$  respectively collide. After collision A moves with a velocity  $(5i)\text{ms}^{-1}$ , Find the

(i) velocity of B after collision

$$M_A U_A + M_B U_B = M_A V_A + M_B V_B$$

$$4(2i + 3j) + 3(5i - 6j) = 4(5i) + 3V_B$$

$$V_B = (i - 2j) \text{ms}^{-1}$$

(ii) loss in kinetic energy

$$\text{k.e before} = \frac{1}{2} \times 4(2^2 + 3^2) + \frac{1}{2} \times 3(5^2 + (-6)^2) = 117.5\text{J}$$

$$\text{k.e after} = \frac{1}{2} \times 4(5^2) + \frac{1}{2} \times 3(1^2 + (-2)^2) = 57.5\text{J}$$

$$\text{Loss in k.e} = 117.5 - 57.5 = 60\text{J}$$

### Example 8

Two bodies A and B of mass 7.5kg and 5.0kg moving with velocities of  $(-i - 2j)\text{ms}^{-1}$  and  $(9i + 8j)\text{ms}^{-1}$  respectively. After collision the bodies stick together and move with a common velocity, find the

(i) common velocity

$$M_A U_A + M_B U_B = (M_A + M_B) V$$

$$7.5(-i - 2j) + 5.0(9i + 8j) = 12.5V$$

$$V = (3i + 2j)\text{ms}^{-1}$$

(ii) percentage loss in kinetic energy

$$\text{k.e before} = \frac{1}{2} \times 7.5((-1)^2 + (-2)^2) + \frac{1}{2} \times 5(9^2 + 8^2) = 381.25\text{J}$$

$$\text{k.e after} = \frac{1}{2} \times 12.5(3^2 + 2^2) = 81.25\text{J}$$

$$\text{Loss in k.e} = 381.25 - 81.25 = 300\text{J}$$

$$\% \text{loss in k.e} = \frac{300}{381.25} \times 100\% = 78.69\%$$

### Example 9

Two bodies A and B of masses 3kg and 2kg respectively are 7m apart on a smooth horizontal surface. A moving directly towards B with a speed of  $2\text{ms}^{-1}$  and acceleration of  $0.3\text{ms}^{-2}$ . B is moving in the same direction as A with a speed of  $5\text{ms}^{-1}$  and retardation of  $0.2\text{ms}^{-2}$ . If the bodies collide and coalesce, calculate

(i) Time taken before collision occurs

let the distance travelled by B before collision =  $x$

$$s = ut + \frac{1}{2} at^2$$

For A:  $7 + x = 2t + \frac{1}{2} \times 0.3t^2$  ..... (i)

For B:  $x = 5t - \frac{1}{2} \times 0.2t^2$  .....(ii)

Subtract (ii) from (i)

$$7 = -3t + 0.25t^2$$

$$t^2 - 12t - 28 = 0$$

$$t = 14s$$

(ii) Common velocity immediately after collision

Initial velocity of A before collision  $V_A = 2 + 0.3 \times 14 = 6.2ms^{-1}$

Initial velocity of B before collision  $V_B = 5 - 0.2 \times 14 = 2.2ms^{-1}$

Let the common velocity be  $V$

$$M_A U_A + M_B U_B = (M_A + M_B) V$$

$$3 \times 6.2 + 2 \times 2.2 = 5V$$

$$V = 4.6ms^{-1}$$

### Recoil velocity of a gun and muzzle velocity of a bullet

When a bullet of mass  $M_b$  is fired with a muzzle velocity of  $V_b$ , the gun of mass  $M_g$  jerks backward with a recoil velocity of  $V_g$ .

$$M_g \times 0 + M_b \times 0 = M_g \times -V_g + M_b V_b$$

$$M_g \times V_g = M_b V_b$$

#### Example 10

A bullet of mass 60g is fired from a gun of mass 3kg. The bullet leaves the gun with velocity of  $400ms^{-1}$ . Find the initial speed of recoil of the gun and gain in kinetic energy of the system.

$$0.06 \times 400 = 3 \times V$$

$$V = 8ms^{-1}$$

$$\text{Gain in k.e} = \text{k.e after} = \frac{1}{2} \times 0.06 \times 400^2 + \frac{1}{2} \times 3 \times 8^2 = 4896J$$

#### Example 11

A gun of mass 3000kg fires horizontally a shell at initial velocity of  $300ms^{-1}$ . If the recoil of the gun is brought to rest by a constant opposing force of 9000N in 2 seconds, find the

(a)(i) Initial velocity of the recoil gun

$$F = ma$$

$$-9000 = 3000a$$

$$a = -3ms^{-2}$$

$$v = u + at$$

$$0 = u - 3 \times 2$$

$$u = 6ms^{-1}$$

(ii) Gain in kinetic energy of the shell just after firing

$$M_g V_g = M_b V_b$$

$$3000 \times 6 = M_b \times 300$$

$$M_b = 60\text{kg}$$

(b)(i) displacement of the gun

$$s = \frac{v^2 - u^2}{2a} = \frac{0^2 - 6^2}{2 \times -3} = 6\text{m}$$

(ii) work done against the opposing force

$$W = F_s = 9000 \times 6 = 54,000\text{J}$$

### Revision exercise

1. A bullet of mass 50g travelling horizontally at  $80\text{ms}^{-1}$  hits a block of wood of mass 10kg resting on a smooth horizontal plane. If the bullet emerges with a speed of  $50\text{ms}^{-1}$ , find the speed with which the block moves. [ $0.15\text{ms}^{-1}$ ]
2. A bullet of mass 0.1kg travelling at  $420\text{ms}^{-1}$  hits a block of wood of mass 2kg resting on a smooth horizontal plane. If the bullet becomes embedded on the block, find the speed with which the block moves after impact. [ $20\text{ms}^{-1}$ ]
3. A 2kg object moving with a velocity of  $8\text{ms}^{-1}$  collides with a 3kg object moving with a velocity  $6\text{ms}^{-1}$  along the same direction. If the collision is completely inelastic, calculate the decrease in kinetic energy. [2.4J]
4. A particle A of mass 150g lies at rest in a smooth horizontal surface. A second particle B of mass 100g is projected along the surface with the speed  $u\text{ms}^{-1}$  and collides directly with A. On collision the masses coalesce and move with speed  $4\text{ms}^{-1}$ . Find the value of  $u$  and loss in the kinetic energy of the system during impact. [ $10\text{ms}^{-1}$ , 3J]
5. Two bodies A and B of masses 2kg and 4kg moving with velocities of  $8\text{ms}^{-1}$  and  $5\text{ms}^{-1}$  respectively collide and move in the same direction. Object A's new velocity is  $6\text{ms}^{-1}$ .
  - (i) find the velocity of B after collision [ $6\text{ms}^{-1}$ ]
  - (ii) calculate the percentage loss in kinetic energy [5.26%]
6. Two bodies A and B of mass 2kg and 3kg moving with velocities of  $4\text{ms}^{-1}$  and  $3\text{ms}^{-1}$  respectively in the same direction collide and coalesce, find he
  - (i) common speed after collision [ $3.4\text{ms}^{-1}$ ]
  - (ii) loss in kinetic energy [0.6J]
  - (iii) percentage loss in kinetic energy [2.03%]
7. A bullet of mass 30g is fired horizontally at  $200\text{ms}^{-1}$  and hits a block of wood of mass 2kg resting on smooth horizontal plane. If the bullet becomes embedded on the block, find the
  - (i) common velocity of bullet and wood. [ $2.96\text{ms}^{-1}$ ]
  - (ii) percentage loss in kinetic energy. [98.52%]
8. Two smooth sphere A and B of equal radii and mass 3kg and 1.5kg respectively are travelling along the same horizontal line in opposite direction. The speeds of A and B are  $6\text{ms}^{-1}$  and  $2\text{ms}^{-1}$  respectively. The sphere A collides and after collision B reverses its direction and moves with speed of  $4\text{ms}^{-1}$ . Find the velocity of A after collision. [ $3\text{ms}^{-1}$ ]
9. Two smooth spheres A and B of equal radii and masses 180g and 100g respectively travelling along the same horizontal line. The initial speeds of A and B are  $2\text{ms}^{-1}$  and  $6\text{ms}^{-1}$  respectively. The spheres collide and after collision both spheres reverse their directions and B moves with speed of  $3\text{ms}^{-1}$ . Find the speed of A after collision and loss in kinetic energy of the system. [ $3\text{ms}^{-1}$ , 0.9J]

10. A particle of mass 2kg moving with speed  $10\text{ms}^{-1}$  collides with stationary particles of mass 7kg. Immediately after impact the particles move with the same speeds but in opposite direction. Find the loss in kinetic energy during collision. [28J].
11. Two identical rail way truck are travelling in the same direction along the same straight piece of track with constant speed of  $6\text{ms}^{-1}$  and  $2\text{ms}^{-1}$ . The faster truck catches up with the other one on collision, the two trucks couple together. Find the common speed of the trucks after collision. [ $4\text{ms}^{-1}$ ]
12. A 2kg object moving with a velocity of  $6\text{ms}^{-1}$  collides with a stationary object of mass 1kg. If the collision is perfectly elastic, calculate the velocity of each object after collision. [ $2\text{ms}^{-1}$ ,  $8\text{ms}^{-1}$ ]
13. A van of mass of mass 1200kg and a lorry of mass 3200kg collide. Just before the crash they are moving directly towards each other and each has a speed of  $12\text{ms}^{-1}$ . Immediately after the crash they move with the same velocity. Find the loss in kinetic energy. [251kJ]
14. A body of mass 6kg moving with velocity  $(8i - 4j)\text{ms}^{-1}$  collides with a body of mass 2kg which is at rest. On collision the two bodies coalesce, find the
  - (i) common velocity after collision [ $(6i - 3j)\text{ms}^{-1}$ ]
  - (ii) loss in kinetic energy [960J]
15. A body of mass 2kg moving with velocity  $(-2i + 4j)\text{ms}^{-1}$  collides with a body of mass 3kg moving with velocity  $(3i + 4j)\text{ms}^{-1}$ . On collision the two bodies coalesce, find the
  - (i) common velocity after collision [ $(i + 4j)\text{ms}^{-1}$ ]
  - (ii) loss in kinetic energy [15J]
16. A body of mass 500g moving with velocity  $(2i - 4j)\text{ms}^{-1}$  collides with a body of mass 1500g moving with velocity  $(6i + 8j)\text{ms}^{-1}$ . On collision the two bodies coalesce, find the
  - (i) common velocity after collision [ $(5i + 5j)\text{ms}^{-1}$ ]
  - (ii) loss in kinetic energy [30J]
17. Two bodies A and B of mass 2kg and 5kg moving with velocities of  $(-2i + 3j)\text{ms}^{-1}$  and  $(6i - 10j)\text{ms}^{-1}$  respectively collide. After collision A moves with velocity  $(3i - 2j)\text{ms}^{-1}$ , find the
  - (i) velocity of B after collision [ $(4i - 8j)\text{ms}^{-1}$ ]
  - (ii) loss in kinetic energy [140J]
18. Two bodies A and B of mass 5kg and 2kg moving with velocities of  $(-4i + 3j)\text{ms}^{-1}$  and  $(3i - 10j)\text{ms}^{-1}$  respectively collide. After collision A moves with a velocity  $(-2i + j)\text{ms}^{-1}$ , find the
  - (i) velocity of B after collision [ $(-2i + 4j)\text{ms}^{-1}$ ]
  - (ii) loss in kinetic energy [40J]
19. A body X, of mass 250g moving with velocity  $(-2i + 3j)\text{ms}^{-1}$  collide with a body Y of mass 750g moving with velocity  $(5i + 8j)\text{ms}^{-1}$ . After collision X moves with a velocity  $(-2i + j)\text{ms}^{-1}$ , find the
  - (i) velocity of Y after collision [ $(4i + 6j)\text{ms}^{-1}$ ]
  - (ii) loss in kinetic energy [5.25J]
20. A shell of mass 5kg is fired from a gun of mass 2000kg. The shell leaves the gun with a velocity of  $400\text{ms}^{-1}$ . find the initial speed of recoil of the rifle and gain in kinetic energy of the system [ $1\text{ms}^{-1}$ , 2520J]
21. A bullet of mass 20g is fired from a rifle of mass 2.5kg. The bullet leaves the gun with a velocity of  $500\text{ms}^{-1}$ . Find the initial of the recoil of rifle and gain in kinetic energy of the system. [ $4\text{ms}^{-1}$ , 2520J]
22. A bullet of mass 5kg is fired from a rifle of mass 2000g. The bullet leaves the gun with a velocity of  $400\text{ms}^{-1}$ . Find the recoil velocity of the rifle. [ $1\text{ms}^{-1}$ ]

Thank you

Dr. Bbosa Science
